ROYAL
AIR FORCE
Youth STEM

The aim of this resource is to give students the opportunity to investigate the impact of science, technology, engineering and mathematics (STEM) on satellite communications.

Skynet

In the 1960s, satellites became an increasingly important way for military to communicate with squadrons abroad. However, only two countries used satellites for signals and military intelligence: the USA and the Soviet Union.

Consequently, the UK created Skynet as its own military communications satellite. The Skynet satellite also provided secure and encrypted facilities for all three of the British armed forces.

The first Skynet satellite, Skynet 1A, was launched in November 1969 but was quickly replaced by Skynet 1B in 1970 following a fault. Unfortunately, Skynet 1B was placed in a geostationary transfer orbit and had to be abandoned in transfer orbit because of a failure of the Thiokol Star 37D apogee kick motor.

Despite the issues faced with Skynet 1A and 1B, engineers persisted with Skynet and launched Skynet 2A in January 1974 and Skynet 2B in November 1974. The Skynet 2 system was very successful for its time, and remained in service for several years beyond the timeframe originally planned.

Satellites

Satellites use radio waves and microwaves depending on the type of communication the satellite is being used for.

Microwaves are used for mobile phones while radio waves are used to transmit television and radio programmes.

Satellites are needed to allow communication over long distances. A signal is sent from a transmitter, such as a TV station, to a satellite. The satellite receives the signal and transmits a receiver, such as a TV dish.

TIME TO INVESTIGATE

Radio waves and microwaves are types of electromagnetic radiation, like light.

Light travels in straight lines and is reflected by shiny surfaces, like a mirror. Satellite dishes use reflection to receive a signal. The dish reflects the radio or microwave to a small receiver in front of the dish.

Key words

Angle of incidence: the angle between the normal and incident ray

Angle of reflection: the angle between the normal and reflected ray

Normal: a line drawn at 90° to the surface of the mirror

Incident ray: the light going towards the mirror

Reflected ray: the light coming away from the mirror

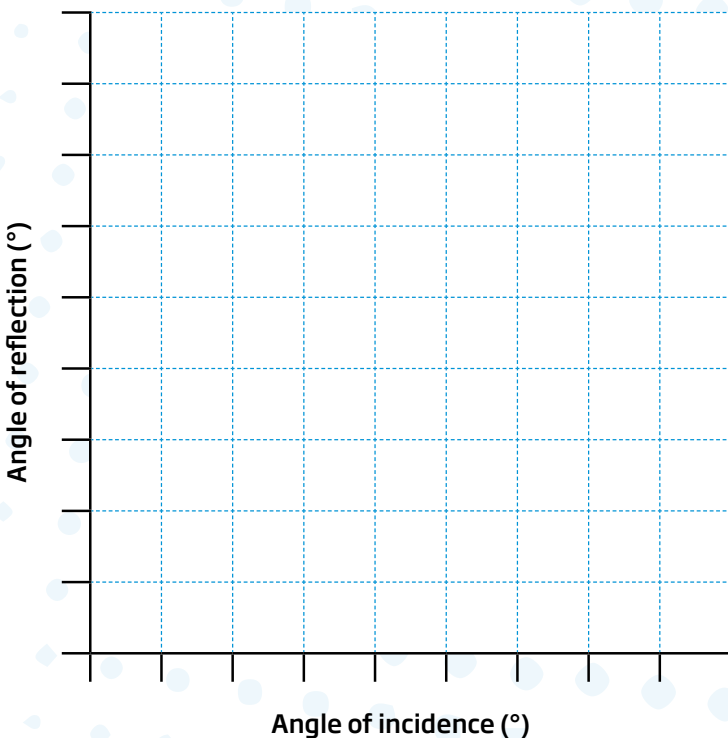

TIME TO INVESTIGATE

In this experiment, you will investigate the relationship between the angle on incidence and the angle of reflection.

1. Draw a line on the paper. Place the mirror on the line and support it so that it does not move.
2. Draw a line at 90° to the mirror; this is the normal line.
3. Shine the beam from the torch towards the mirror. Use the pencil to carefully mark two dots in the centre of the incidence and reflected rays.
4. Move the mirror to one side and use the ruler to join the dots to show the complete path of the ray. Add arrows so that you know what direction the ray travelled.
5. Use the protractor to measure the angle between the normal and the incident ray, and the normal and the reflected ray
6. Repeat three more time with different angles of incidence.

| Angle of incidence | Angle of reflection |
|--------------------|---------------------|
| | |
| | |
| | |

Complete the graph with your results

Complete the conclusion below:

From my experiment, I can see that the angle of incidence is the angle of reflection.

I can tell this because

Royal Academy of Engineering

The Royal Academy of Engineering is harnessing the power of engineering to build a sustainable society and an inclusive economy that works for everyone.

In collaboration with our Fellows and partners, we're growing talent and developing skills for the future, driving innovation and building global partnerships, and influencing policy and engaging the public.

Together we're working to tackle the greatest challenges of our age.

What we do

Talent & diversity

We're growing talent by training, supporting, mentoring and funding the most talented and creative researchers, innovators and leaders from across the engineering profession.

We're developing skills for the future by identifying the challenges of an ever-changing world and developing the skills and approaches we need to build a resilient and diverse engineering profession.

Innovation

We're driving innovation by investing in some of the country's most creative and exciting engineering ideas and businesses.

We're building global partnerships that bring the world's best engineers from industry, entrepreneurship and academia together to collaborate on creative innovations that address the greatest global challenges of our age.

Policy & engagement

We're influencing policy through the National Engineering Policy Centre – providing independent expert support to policymakers on issues of importance.

We're engaging the public by opening their eyes to the wonders of engineering and inspiring young people to become the next generation of engineers.

The RAF Youth STEM programme is designed to engage and inspire young people by building their interest in engineering and technical career pathways.

From cyber specialists to aerospace, aviation, electronics, and mechanical disciplines, the RAF is committed to widening participation in STEM, extending opportunities to all, and encouraging greater diversity in this critical area of national skills shortages.
